

Adding a Remote Windows Host to Nagios Server

You need to install **NSClient++** agent on the Windows Host system.

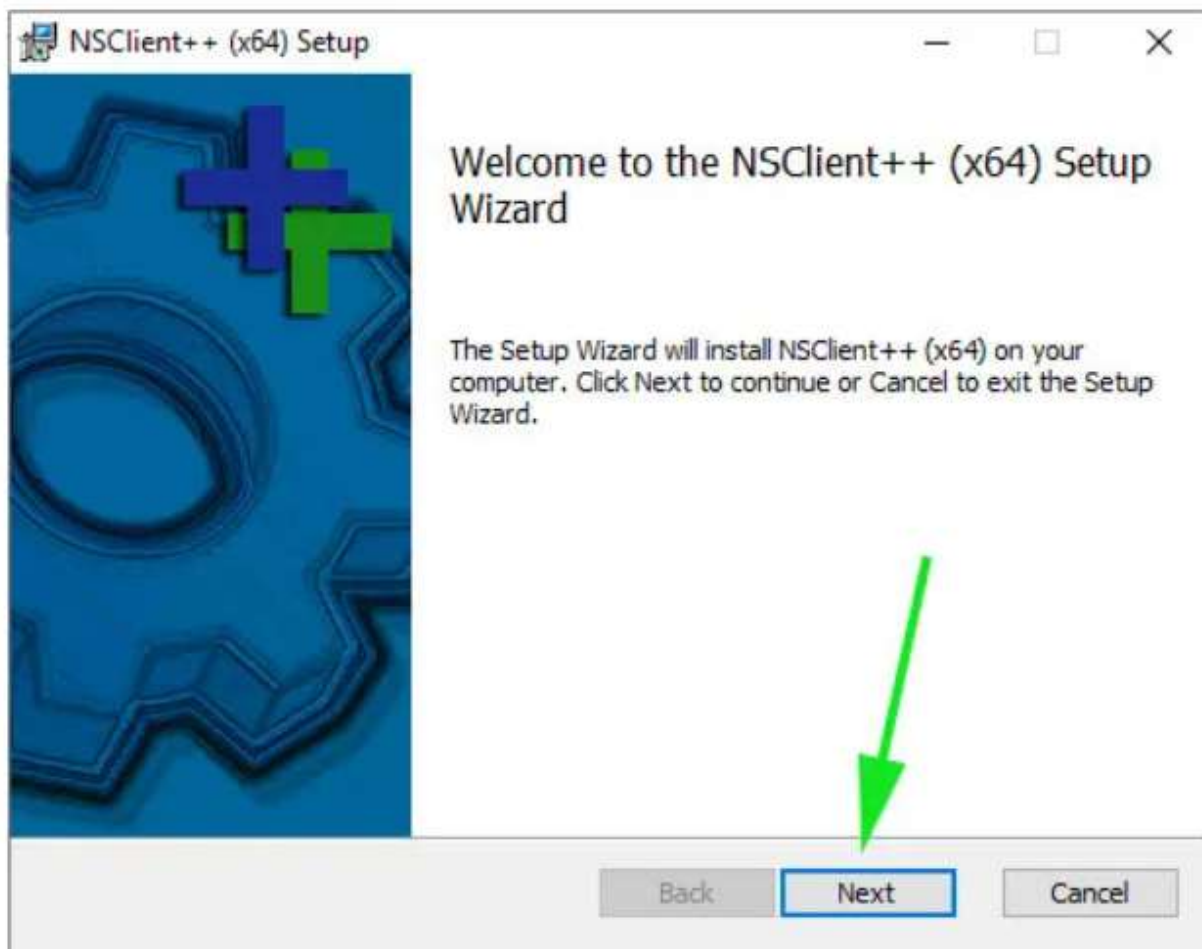

We are going to install the NSClient++ on a Windows Server 2019 Datacenter edition.

On the Windows host system, head out to the download link as specified <https://sourceforge.net/projects/nscplus/> and download NSClient ++ agent.

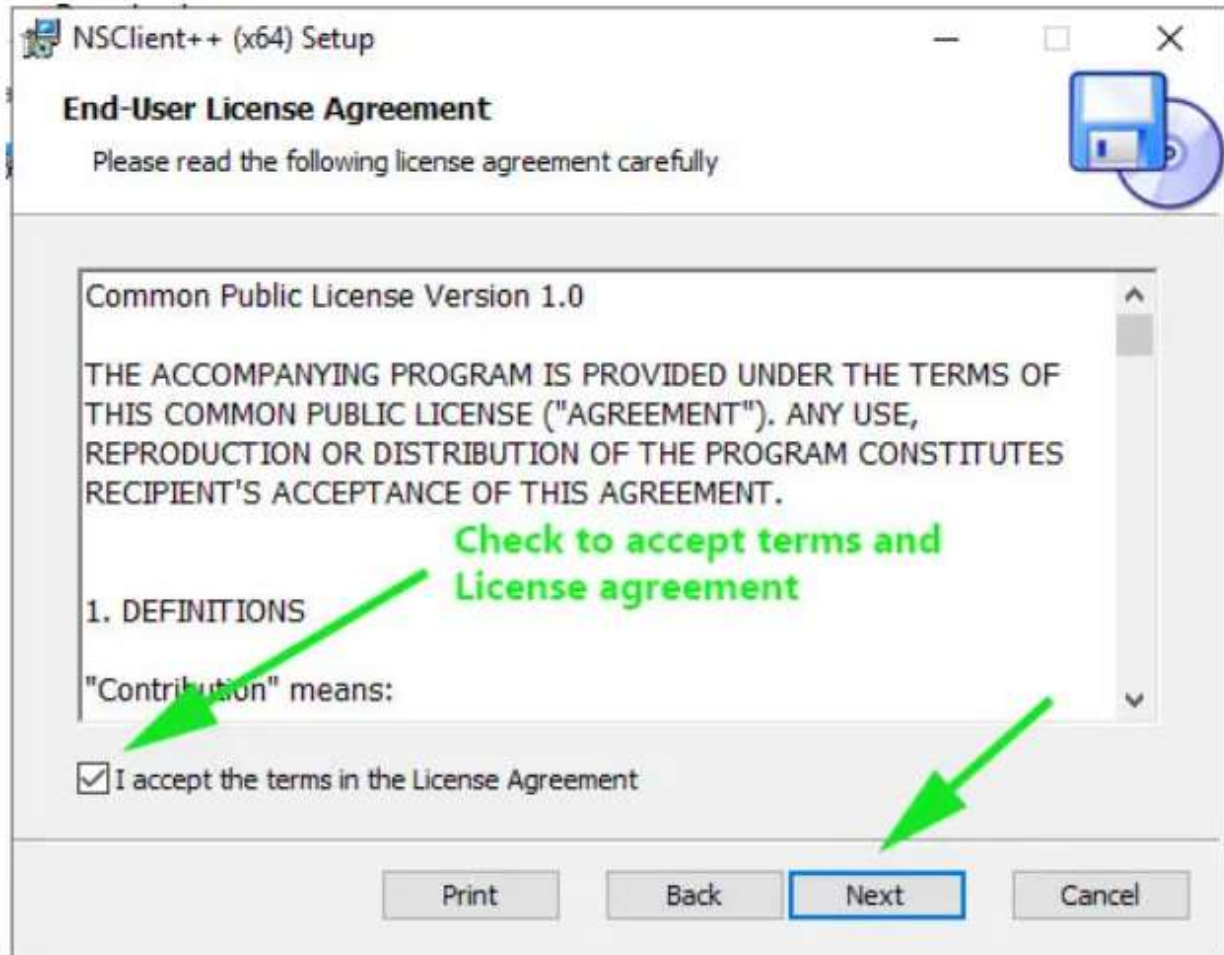

Once downloaded, double click on the downloaded installation file to launch the installation wizard.

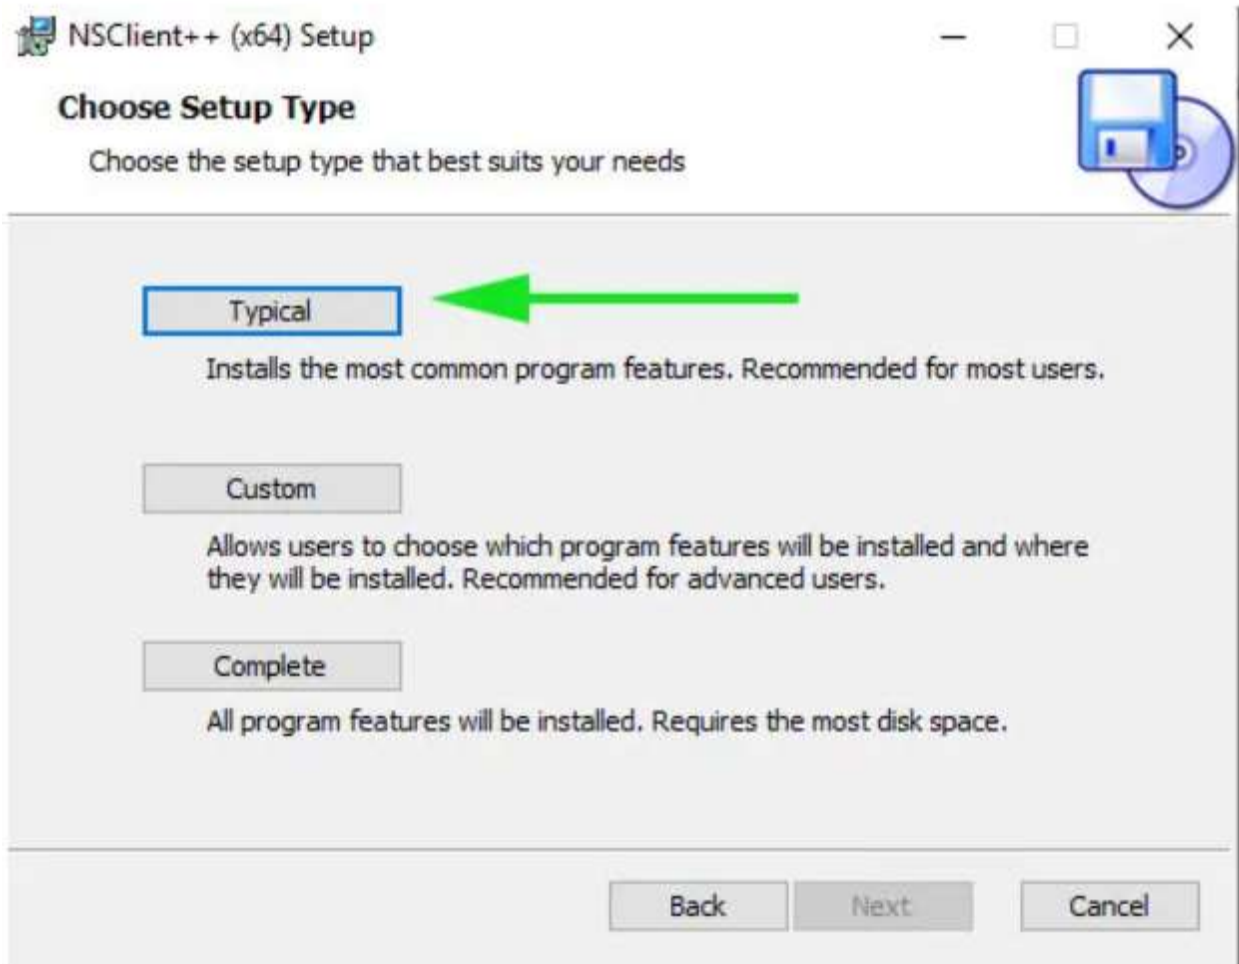

On the first step on the installation procedure click '**Next**'

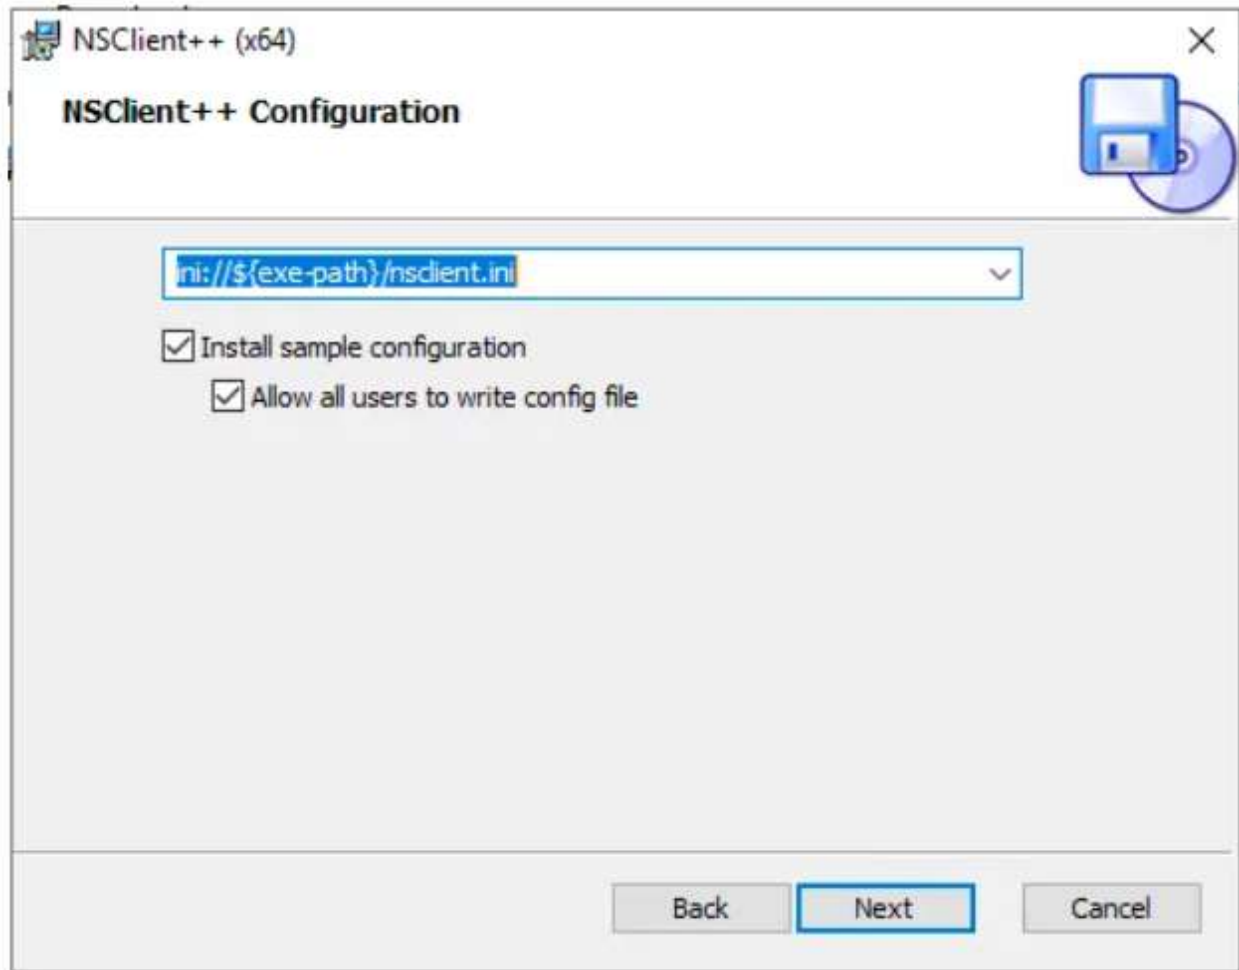

In the next section, check off the **'I accept the terms in the license Agreement'** checkbox and click **'Next'**

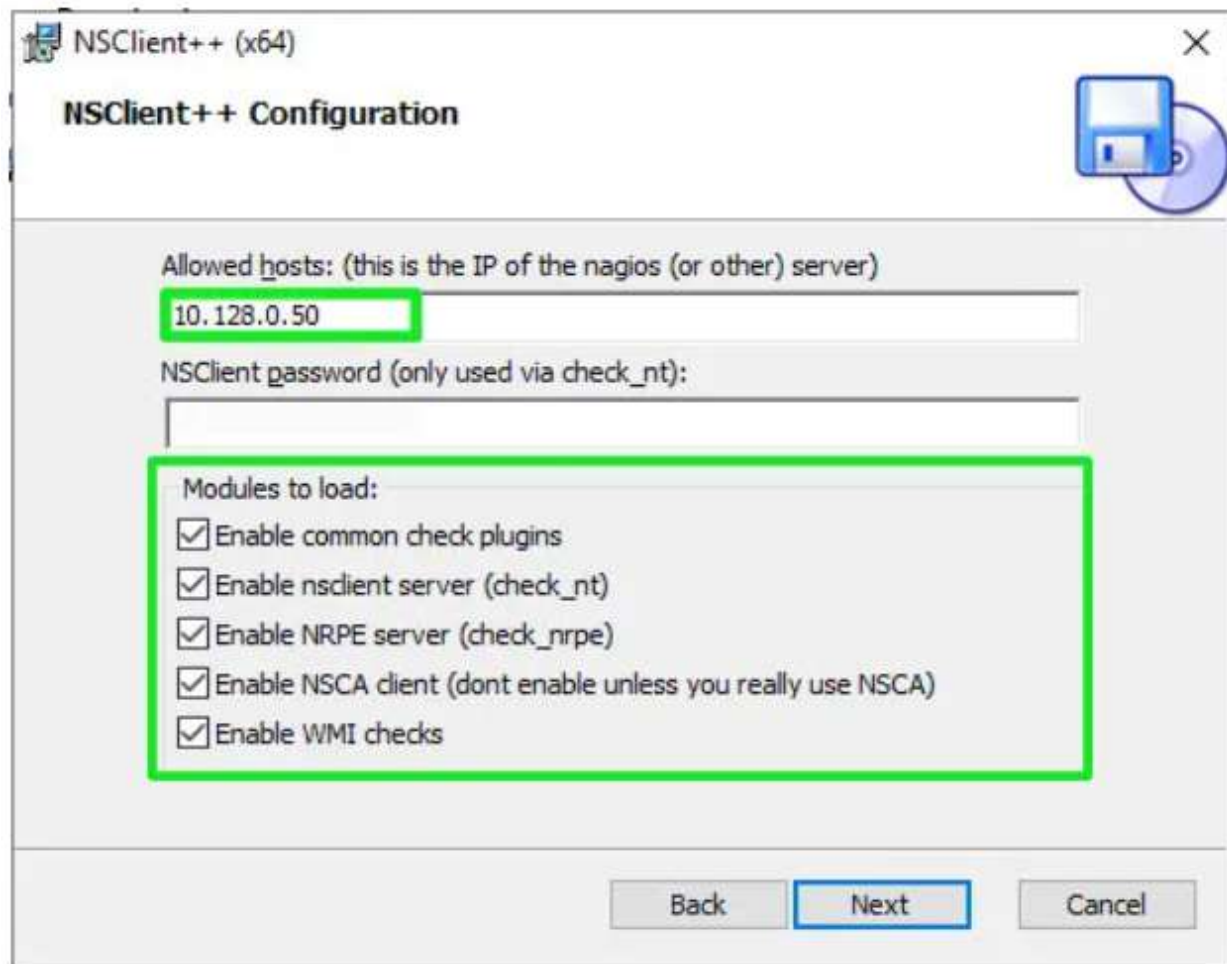

Next, click on the **'Typical'** option from the list of options and click **'Next'**

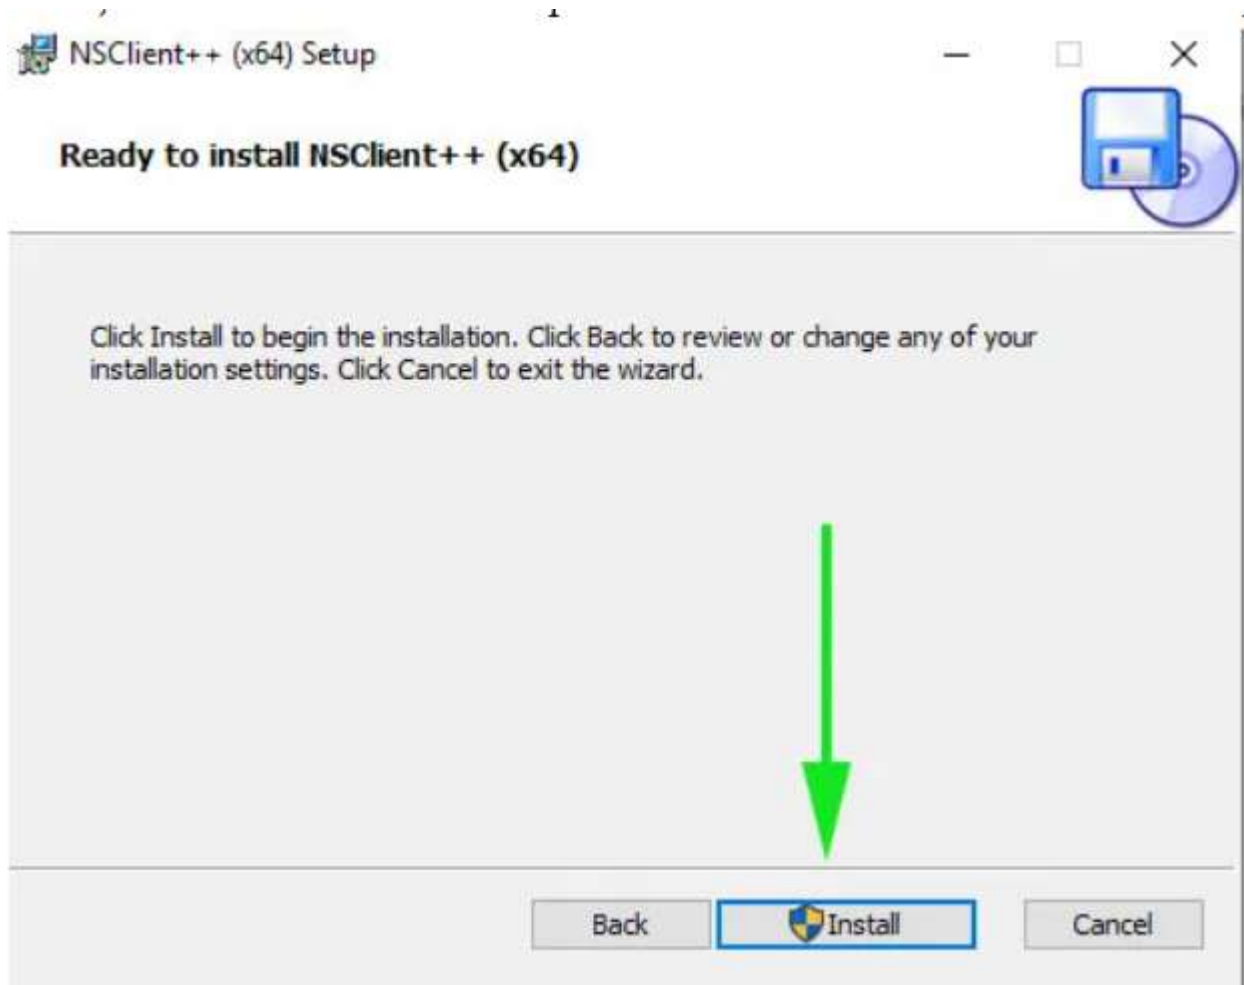

In the next step, leave the default settings as they are and click '**Next**'.

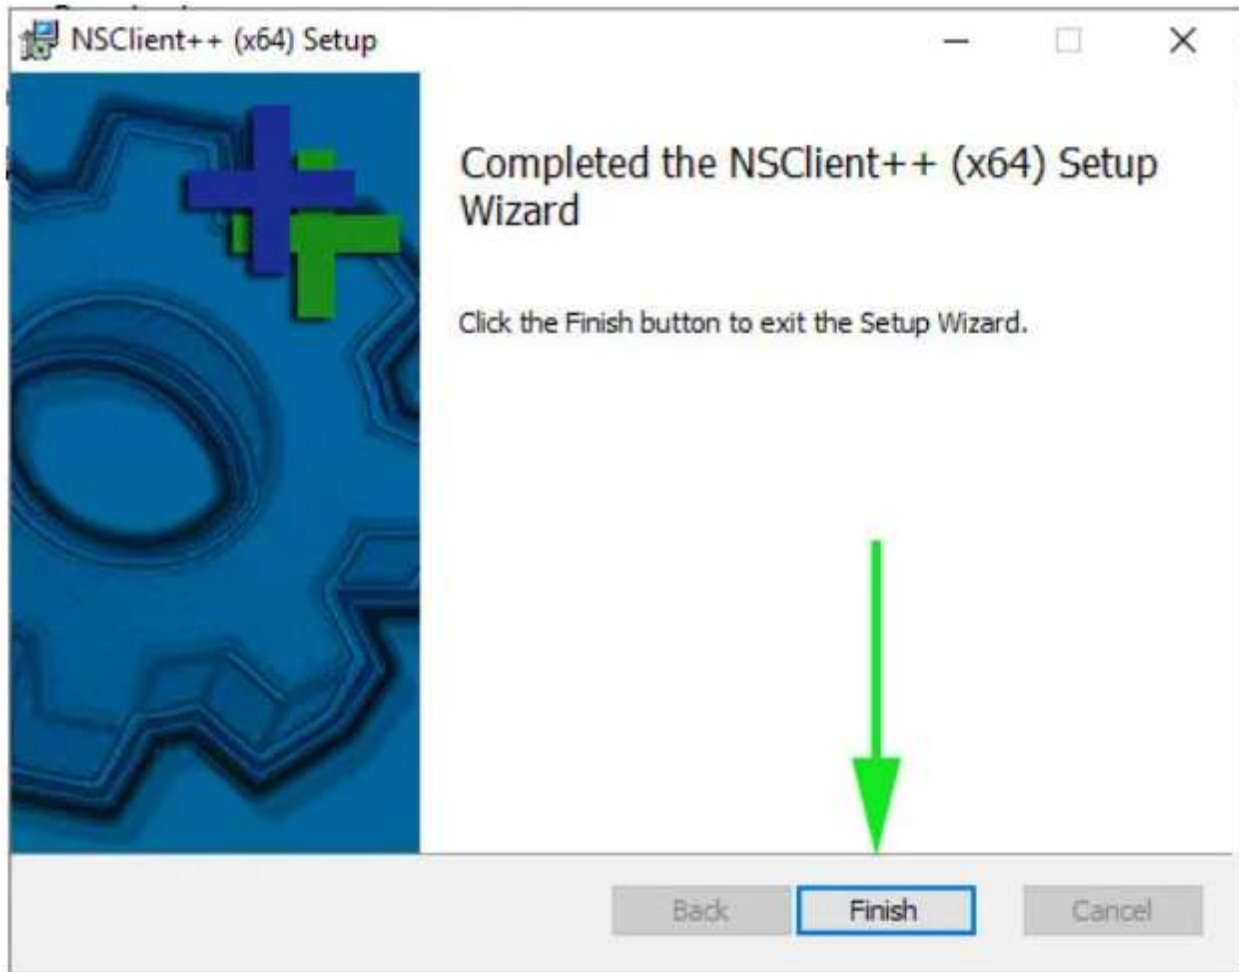

On the next page, specify your Nagios Server core's IP address and tick off all the modules and click '**Next**' as shown below.

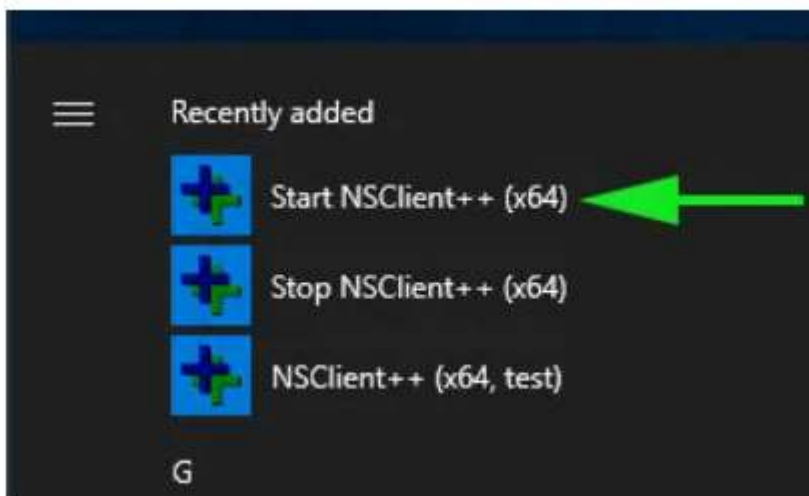

Next, click on the **Install** option to commence the installation process.

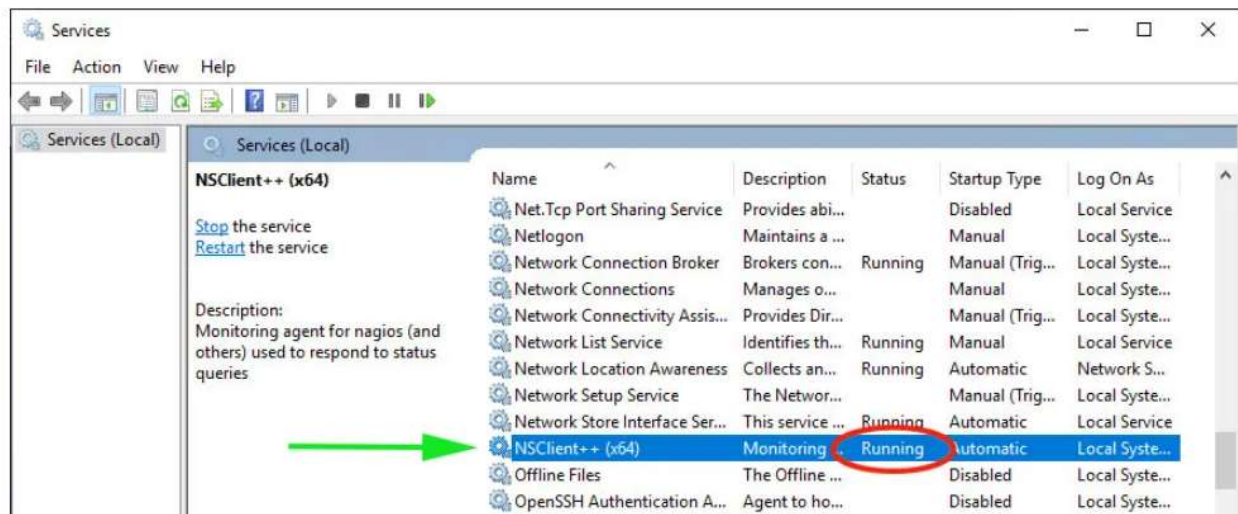

The installation process will start and will take a couple of seconds to complete. On the last step, Click '**Finish**' to complete the installation and exit the Wizard.

To start the NSClient service, click on the **Start** menu and click on the '**Start NSClient ++**' option.

To confirm that indeed the service is running, press **Windows Key + R**, type `services.msc` and hit **ENTER**. Scroll and search for the **NSClient** service and ensure it's running

At this point, we have successfully installed NSClient++ on Windows Server 2019 host and verified that it's running.

Configure Nagios Server to monitor Windows host

After the successful installation of the NSClient ++ on the Windows host PC, log in to the Nagios server Core system and configure it to monitor the Windows host system.

Open the windows.cfg file using your favorite text editor

```
# vim /usr/local/nagios/etc/objects/windows.cfg
```

In the configuration file, ensure that the `host_name` attribute matches the hostname of your Windows client system. In our case, the hostname for the Windows server PC is windows-server. This hostname should apply for all the `host_name` attributes.

For the address attribute, specify your Windows host IP address. , In our case, this was 10.128.0.52.

```
#####
#
# HOST DEFINITIONS
#####

# Define a host for the Windows machine we'll be monitoring
# Change the host_name, alias, and address to fit your situation

define host {

    use                windows-server          ; Inherit default values from a template
    host_name          windows-server          ; The name we're giving to this host
    alias              My Windows Server       ; A longer name associated with the host
    address            10.128.0.52             ; IP address of the host
}

#####
```

After you are done, save the changes and exit the text editor.

Next, open the Nagios configuration file.

```
# vim /usr/local/nagios/etc/nagios.cfg
```

Uncomment the line below and save the changes.

```
cfg_file=/usr/local/nagios/etc/objects/windows.cfg
```

```
# Definitions for monitoring a Windows machine
cfg_file=/usr/local/nagios/etc/objects/windows.cfg
```

Finally, to verify that Nagios configuration is free from any errors, run the command:

```
# /usr/local/nagios/bin/nagios -v /usr/local/nagios/etc/nagios.cfg
```

Output:

```
[root@centos-8 ~]# /usr/local/nagios/bin/nagios -v /usr/local/nagios/etc/nagios.cfg

Total Warnings: 0
Total Errors: 0

Things look okay - No serious problems were detected during the pre-flight check
```

As you can see from the output, there are no warnings or errors.

Now browse your Nagios Server IP address, log in and click on Hosts. Your Windows hostname, in this case, windows-server will appear on the dashboard.

The screenshot shows the Nagios web interface at the URL 34.69.47.26/nagios/. The interface is divided into several sections:

- General:** Home, Documentation.
- Current Status:** Tactical Overview, Map (Legacy), Hosts, Services, Host Groups, Summary, Grid, Service Groups, Summary, Grid, Problems, Services (Unhandled), Hosts (Unhandled), Network Outages.
- Quick Search:** A search bar.
- Current Network Status:** Last Updated: Thu Oct 31 11:07:05 UTC 2019. Updated every 60 seconds. Nagios® Core™ 4.4.5 - www.nagios.org. Logged in as nagiosadmin.
- Host Status Totals:** Up: 2, Down: 0, Unreachable: 0, Pending: 0. All Problems: 0, All Types: 2.
- Service Status Totals:** Ok: 6, Warning: 1, Unknown: 5, Critical: 1, Pending: 2. All Problems: 7, All Types: 15.
- Host Status Details For All Host Groups:** A table showing the status of hosts.

The table has the following columns: Host, Status, Last Check, Duration, and Status Information. The data is as follows:

Host	Status	Last Check	Duration	Status Information
localhost	UP	10-31-2019 11:03:11	0d 1h 13m 16s	PING OK - Packet loss = 0%, RTA = 0.08 ms
windows-server	UP	10-31-2019 11:05:47	0d 0h 5m 11s	PING OK - Packet loss = 0%, RTA = 3.40 ms

A red arrow points to the 'windows-server' entry in the table. Below the table, the text 'Results 1 - 2 of 2 Matching Hosts' is displayed. A red text label at the bottom right of the screenshot reads: 'Windows host added to Nagios Server and monitored'.
